We apologize for the inconvenience and hope to be back to normal before long." Update (February 15, 2015) On February 15, 2015, the Internet Archive announced they were going to shut down the Wayback Machine completely in response to the Internet Archive's decision to sell the Wayback Machine back to Internet Archive in 2013. "This move is a long time coming", said Brewster Kahle, Executive Director of the Internet Archive. "It is a perfect time to do so. We've been working on alternatives for several years, but we've finally come to a point where we believe that those alternatives are viable and ready for the prime time." "The decision to shut down our flagship service does not come easily", said Kahle. "As we've explained before, the internet archive is more than just the Wayback Machine. Our team is working on multiple projects to capture the historical web and to make it publicly available. With today's announcement, we are stepping up that effort, and we hope that what we are doing will make it clear that the past is worth preserving." Update (July 19, 2015) The Wayback Machine has been back online since July 19, 2015, albeit still partially offline, and as of January 2016, the "web archive" has changed its name to the "Wayback Machine" after several years as "Internet Archive".

I am working on a program that I got from others where the contract is that all inputs are safe to convert to int. I have tested a few of them, but I do not know if the contract is true for the rest of them. Can you please show me which of these conversions are unsafe and which are safe? int convertToInt(char\* b) { return b[0] - '0'; } int convertToInt(string s) int i = 0; while (s[i] != '\0') i++; return i; int convertToInt(string s, int lo, int hi) return s[lo] - '0'; }
